
FL7703NI Data Sheet

TFT Mobile Single Chip Driver
For 720RGB x 2047 dot, a-Si TFT LCD, 16.7M color
With MIPI Interface

Version 0.7 Preliminary
Otc. 2025

Forcelead Technology Corporation

List of Contents

1.	General Description	8
2.	Features	9
3.	Block Diagram	10
4.	Pin Description	11
4.1	Power Supply Pins	11
4.2	Interface Logic Pins	11
4.3	MIPI Interface Pins	11
4.4	Driver Output Pins	12
4.5	DC/DC Converter Pins	12
4.6	CABC Control Pins	12
4.7	Test Pins	13
4.8	BOM	14
5.	Function Description	15
5.1	SPI Interface	15
5.1.1	SPI Interface Write Mode	15
5.1.2	SPI Interface Read Mode	16
5.1.3	Break and Pause Sequences	17
5.2	MIPI Interface	19
5.2.1	DSI General Interface Communication	20
5.2.2	DSI Packet Level Communication	31
5.3	Inversion	44
5.4	Gamma Function	46
5.4.1	Gamma Characteristic Correction Function	47
5.4.2	Gray Voltage Generator for Digital Gamma Correction	48
5.5	Sleep Out - command and Self-diagnostic Functions of the display module	50
5.5.1	Register Loading Detection	50
5.5.2	Functionality Detection	51
5.6	Power on/off Sequence	52
5.6.1	Case 1: RESX line is held high or unstable by host at power on	53
5.6.2	Case 2: RESX line is held low by host at power on	54
5.7	Power Levels Definition	55
5.8	Reset function	56
5.8.1	Standard Command Default Value	56
5.8.2	Input Pins	57
5.8.3	Output or Bi-directional Pins	57
5.9	OTP Sequence	58
5.9.1	OTP Sequence	58
5.9.2	OTP Standard Programming Table	59
5.10	CABC	60
6.	Command Description	62
6.1	Command Table	62
6.2	Command description	78
6.2.1	NOP (00h)	78
6.2.2	Software reset (01h)	79
6.2.3	Read Display ID (04h)	80
6.2.4	Read Display Power Mode (0Ah)	81
6.2.5	Read Display MADCTR (0Bh)	82
6.2.6	Read Display Pixel Format (0Ch)	83
6.2.7	Read Display Image Mode (0Dh)	84
6.2.8	Read Display Signal Mode (0Eh)	85
6.2.9	Read Display Self-Diagnostic Result (0Fh)	86
6.2.10	Sleep In (10h)	87
6.2.11	Sleep Out (11h)	88

6.2.12	Normal Display Mode On (13h)	90
6.2.13	Display Inversion Off (20h)	91
6.2.14	Display Inversion On (21h)	92
6.2.15	All Pixel Off (22h)	93
6.2.16	All Pixel On (23h)	94
6.2.17	Display Off (28h)	95
6.2.18	Display On (29h)	96
6.2.19	Memory Access Control (36h)	97
6.2.20	Idle Mode Off (38h)	98
6.2.21	Idle Mode On (39h)	99
6.2.22	Write Display Brightness (51h)	101
6.2.23	Read Display Brightness (52h)	102
6.2.24	Write CTRL Display (53h)	103
6.2.25	Read CTRL Display Value (54h)	104
6.2.26	Write Content Adaptive Brightness Control (55h)	105
6.2.27	Read Content Adaptive Brightness Control (56h)	106
6.2.28	Write CABC Minimum Brightness (5Eh)	107
6.2.29	Read CABC minimum brightness (5Fh)	108
6.2.30	Read Black/White Low Bits (70h)	109
6.2.31	Read Bkx (71h)	110
6.2.32	Read Bky (72h)	111
6.2.33	Read Wx (73h)	112
6.2.34	Read Wy (74h)	113
6.2.35	Read Red/Green Low Bits (75h)	114
6.2.36	Read Rx (76h)	115
6.2.37	Read Ry (77h)	116
6.2.38	Read Gx (78h)	117
6.2.39	Read Gy (79h)	118
6.2.40	Read Blue/AColor Low Bits (7Ah)	119
6.2.41	Read Bx (7Bh)	120
6.2.42	Read By (7Ch)	121
6.2.43	Read Ax (7Dh)	122
6.2.44	Read Ay (7Eh)	123
6.2.45	Read DDB Start (A1h)	124
6.2.46	Read DDB Continue (A8h)	126
6.2.47	Read ID1 Value (DAh)	127
6.2.48	Read ID2 Value (DBh)	128
6.2.49	Read ID3 Value (DCh)	129
6.2.50	SETEXTC (B9h)	130
6.2.51	SETAPPLEID (B1h)	131
6.2.52	SETDISP (B2h)	132

0.7	2025/03	#Update DUMMYR1 function
	2025/10	# Adjust Power-Up Timing

1. General Description

The FL7703NI is a single-chip solution for a-Si TFT LCD that combines a source driver, power supply circuit to drive a-Si TFT dot matrix LCD with 720RGBx2047 dots at maximum. The FL7703NI supports MIPI Interface.

The FL7703NI incorporates step-up and voltage follower circuits to generate drive voltage required for a-Si TFT and gate in panel (GIP) which including a dynamic backlight control function to control backlight brightness depending on image data, reducing power consumption at the backlight with the slightest influence on image quality.

The FL7703NI is suitable for small or medium-sized portable mobile solutions requiring long-term driving capabilities, such as digital mobile phones, PDAs and Smartphones.

2. Features

- Single chip solution for a HD720 GIP (Gate In Panel) type TFT LCD display
- Display Resolution:
 - 720RGB x (4xNL + RES_V_LSB)
 - 640RGB x (4xNL + RES_V_LSB)
 - 600RGB x (4xNL + RES_V_LSB)
 - 540RGB x (4xNL + RES_V_LSB)
 - 440RGB x (4xNL + RES_V_LSB)
 - 400RGB x (4xNL + RES_V_LSB)
 - 480RGB x (4xNL + RES_V_LSB)
- Display Color Modes:
 - Full color mode: 16.7M colors
 - Reduce color mode: 262k colors
 - Reduce color mode: 65k colors
 - Idle mode: 8 colors
- Display Interface:
 - MIPI Display Serial Interface (DSI V1.01)
 - 2 Lane maximum speed 800Mbps
 - 3 Lane maximum speed 700Mbps
 - 4 Lane maximum speed 600Mbps
- On chip:
 - VGH/VGL for GIP gate control
 - 1-dot / 1+2-dot / 2-dot / 3-dot / 4-dot / 8-dot / column / Zig-Zag inversion
 - Gamma correction function
 - Oscillator for display clock generation
 - Internal OTP programming voltage generator
 - 4 times MTP for VCOM setting、ID setting
 - CAB (Content Adaptive Brightness Control) function
 - DGC (Digital Gamma Correction) function
 - Color Enhancement function
- Input power:
 - External power IC and PFM:
 - I/O and interface power supply (IOVCC): 1.65V to 3.6V
 - Analog power supply (VCI): 2.5V to 3.3V
 - Three-Power Mode:
 - I/O and interface power supply (IOVCC): 1.65V to 3.6V
 - Analog power supply (VSP): 4.5V to 6.2V
 - Analog power supply (VSN): -4.5V to -6.2V
- Output voltage:
 - Positive source output voltage level: VSPR=3.3V to 5.6V
 - Negative source output voltage level: VSNR=-5.6V to -3.3V
 - Positive gate driver output voltage level: VGH=+10V to +20V
 - Negative gate driver output voltage level: VGL=-7.5V to -15V
 - VCOM=-3.5V to 0V

4. Pin Description

4.1 Power Supply Pins

Symbol	Name	Description	Connection when not used
IOVCC	I/O Power	Power supply for logic circuit.	-
VCI	Analog Power	Power supply for analog circuit.	-
VSSA	Analog GND	System ground for analog system.	-
VSSD	I/O GND	System ground for logic circuit.	-
DSI_VSS	MIPI GND	DSI interface analog ground.	-

4.2 Interface Logic Pins

Symbol	I/O	Description								Connection when not used
IM1~0 LANSEL	I	Interface mode select pins. IM1~IM0 and LANSEL are used for the combination of polarity swap and data lane swap of DSI.								GND
		IM1	IM0	LANSEL	D0P/N	D1P/N	CP/N	D2P/N	D3P/N	
		0	0	0	D3P/N	D2P/N	CP/N	D1P/N	D0P/N	
		0	1	0	D3N/P	D2N/P	CN/P	D1N/P	D0N/P	
		1	0	0	D0P/N	D1P/N	CP/N	D2P/N	D3P/N	
		1	1	0	D0N/P	D1N/P	CN/P	D2N/P	D3N/P	
		0	0	1	D2P/N	D1P/N	CP/N	D0P/N	D3P/N	
		0	1	1	D2N/P	D1N/P	CN/P	D0N/P	D3N/P	
		1	0	1	D3P/N	D0P/N	CP/N	D1P/N	D2P/N	
		1	1	1	D3N/P	D0N/P	CN/P	D1N/P	D2N/P	
RESX	I	Reset pin. This signal will reset the device and must be applied to properly initialize the chip.								-
VOUT	O	Frame synchronization output signal pin.								OPEN
HOUT	O	Scan line synchronization output signal pin.								OPEN

Note: "1" = IOVCC Level, "0" = VSSD Level.

4.3 MIPI Interface Pins

Symbol	I/O	Description	Connection when not used
DSI_D0P, DSI_D0P	I/O	High speed interface data differential signal input/output pins.	OPEN/GND
DSI_CP, DSI_CN	I	High speed interface clock differential signal input pins.	OPEN/GND
DSI_D3P~1P, DSI_D3N~1N	I	High speed interface data differential signal input pins.	OPEN/GND

4.4 Driver Output Pins

Symbol	I/O	Description	Connection when not used
S1 to S1080 S1321 to S2400	O	Pixel electrode driving output	Open
		Display Resolution	
		Used Source Pins	
		720RGB	
		640RGB	
		600RGB	
		540RGB	
		440RGB	
CGOUTL_1~22 CGOUTR_1~22	O	Gate control signals for panel.	Open
VCOM	O	Regulator output for common voltage of panel	-

4.5 DC/DC Converter Pins

Symbol	I/O	Description	Connection when not used
VSP	I	Input voltage from the set-up circuit.	-
VSN	I	Input voltage from the set-up circuit.	-
VGH	O	Output voltage from the step-up circuit.	-
VGL	O	Output voltage from the step-up circuit.	-
DSI_LDO	O	High speed interface regulator output pin.	Open
VSPROUT	O	Output voltage generated from VSP. Output for positive gamma voltage generator.	-
VSNROUT	O	Output voltage generated from VSN. Output for negative gamma voltage generator.	-
VDDD	O	Reference voltage for internal logic.	-
VTRIMOUT	O	Reference voltage for internal voltage generating circuit.	-
VCSW1	O	PFM and Power IC control output for DC/DC converter to generate VSP.	-
VCSW2	O	PFM and Power IC control output for DC/DC converter to generate VSN.	-

4.6 CABC Control Pins

Symbol	I/O	Description	Connection when not used
PWM	O	This pin is connecting with the external LED driver.	Open

4.7 Test Pins

Symbol	I/O	Description	Connection when not used
OSC	I	Oscillator test pin	Open
CSX	I	Chip select input pin ("Low" enable) in RGB I/F test mode.	OPEN
DCX	I	Command/parameter selection in RGB I/F test mode. Low: Select command. High: Select data.	IOVCC/GND/ OPEN
SCL	I	A synchronous clock signals in RGB I/F test mode.	IOVCC/GND/ OPEN
SDA	I/O	Serial data input/output pin in RGB I/F test mode.	IOVCC/GND/ OPEN
SDO	O	A serial data output pin in RGB I/F test mode.	OPEN
T_DB7~0	I	8-bit input data bus in RGB I/F test mode.	IOVCC/GND/ OPEN
T_IM	I	Let driver IC into RGB I/F test mode if set T_IM= high.	Open
OSC_OUT	O	Test pin.	Open
NVDDDOUT	O	Test pin.	Open
NVTRIMOUT	O	Test pin.	Open
VREFOUT	O	Test pin.	Open
NVREFOUT	O	Test pin.	Open
VTESTOUTP	O	Test pin.	Open
VTESTOUTN	O	Test pin.	Open
DUMMYR1	-	No use.	IOVCC/GND/ OPEN
DUMMY406~1	-	No use.	IOVCC/GND/ OPEN
DUMMY_PM0 DUMMY_PM1	-	No use.	IOVCC/GND/ OPEN
DUMMY_RS0 DUMMY_RS1	-	No use.	IOVCC/GND/ OPEN
DUMMY_TEMP	-	No use.	IOVCC/GND/ OPEN

Note: "1" = IOVCC Level, "0" = VSSD Level.

Note: "X" = Don't care.

11	DSI_LDO	-	-	Don't need Capacitance
12	VCOM	-	-	Don't need Capacitance

Table 4-2: BOM of 3 Power Mode

5. Function Description

5.1 SPI Interface

The selection of serial interface is by T_IM. FL7703NI can support DPI/DBI type-C Option 1.

T_IM	Interface mode
0	MIPI Interface
1	DPI/DBI type-C Option 1 (9-bit SPI)

Table 5-1: DBI TYPE-C Serial Interface Selection Table

The serial interface is used to communication between the MPU and the LCD driver chip. It contains CSX (chip select), SCL (serial clock), SDA (serial data input/output). Serial clock (SCL) can be stopped when no communication is necessary.

5.1.1 SPI Interface Write Mode

In SPI I/F Write Mode, the serial data packet contains a control bit DCX and a transmission byte. If DCX is low, the transmission byte is command byte. If DCX is high, the transmission byte is stored in to command register. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or serial input/output data (SDA/SDO) have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

Figure 5-1: DBI Type C interface Option 1 write mode

5.1.2 SPI Interface Read Mode

In SPI I/F Read Mode, the host controller first has to send a command and then the following byte is transmitted to host controller in the SDA. The read mode has two type : one is command data 8-bits read and one is over 8-bits read.

Figure 5-2: DBI Type C interface Option 1 read mode

5.1.3 Break and Pause Sequences

If there is a break on data transmission when transmit a command before a whole byte has been completed, then the driver IC will have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following figure.

Figure 5-3: Driver IC data transfer recovery

If a one or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than retransmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown:

Figure 5-4: Break during parameter

The host processor can pause a write sequence by pulling the CSX signal high between command or data bytes. The driver IC shall wait for the host processor to drive CSX low before continuing the write sequence at the point where the sequence was paused.

Figure 5-5: Driver IC data transfer pause

There are 4 cases where there is possible to see this kind of pause:

1. Command – Pause – Command
2. Command – Pause – Parameter
3. Parameter – Pause – Command
4. Parameter – Pause – Parameter

5.2 MIPI Interface

The Display Serial Interface standard defines protocols between a host processor and peripheral devices that adhere to MIPI Alliance standards for mobile device interfaces. The DSI standard builds on existing standards by adopting pixel formats and command set defined in MIPI Alliance standards.

DSI-compliant peripherals support either of two basic modes of operation: Command Mode and Video Mode. Which mode is used depends on the architecture and capabilities of the peripheral. The FL7703NI only support Video mode.

Video Mode refers to operation in which transfers from the host processor to the peripheral take the form of a real-time pixel stream. In normal operation, the driver IC relies on the host processor to provide image data at sufficient bandwidth to avoid flicker or other visible artifacts in the displayed image. Video information should only be transmitted using High Speed Mode.

Lane Pair	HOST(Master)/ Driver IC(Slave)
Clock Lane	- Unidirectional Lane - Clock Only - Escape mode (ULPS only)
Data Lane 0	- Bi-directional Lane - Forward High Speed - Bi-directional Escape Mode - Bi-directional LPDT
Data Lane 1 Data Lane 2 Data Lane 3	- Unidirectional Lane - Forward High Speed - Escape mode (ULPS only) - NO LPDT

Table 5-2: MIPI Interface Configuration

5.2.1 DSI General Interface Communication

The driver IC uses data and clock lane differential pairs for DSI. Both differential lane pairs can be driven Low Power (LP) or High Speed (HS) mode. Low Power mode means that each line of the differential pair is used in single end mode and a differential receiver is disable (A termination resistor of the receiver is disable) and it can be driven into a low power mode.

High Speed mode means that differential pairs (The termination resistor of the receiver is enable) are not used in the single end mode. There are used different modes and protocol in each mode when there is wanted to transfer information from the HOST to the driver IC and vice versa.

State code	Line voltage Levels		High speed	Low power	
	DP	DN		Control mode	Escape mode
HS-0	HS Low	HS High	Differential-0	Note 1	Note 1
HS-1	HS High	HS Low	Differential-1	Note 1	Note 1
LP-00	LP Low	LP Low	N/A	Bridge	Space
LP-01	LP Low	LP High	N/A	HS-Rqst	Mark-0
LP-10	LP High	LP Low	N/A	LP-Rqst	Mark-1
LP-11	LP High	LP High	N/A	Stop	Note 2

Note 1 : During high-speed transmission, the low power receivers observe LP-00 on the lines.

Note 2 :If LP-11 occurs during Escape mode, the lane returns to Stop state (Control mode LP-11)

Table 5-3: Lane State Description

5.2.1.1 DSI Clock Lane

The principle flow chart of the different clock lanes power modes is illustrated below.

Figure 5-6: DSI Clock Lane State Diagram

LK+/- lanes can be driven to the Low Power Mode (LPM), when DSI-CLK lanes are entering LP-11:

1. After SW Reset, HW Reset or Power On Sequence =>LP-11
2. After DSI-CLK+/- lanes are leaving Ultra Low Power Mode (ULPM, LP-00) =>LP-10 =>LP-11 (LPM). This sequence is illustrated below.

Figure 5-7: From ULPM to LPM

3. After DSI-CLK+/- lanes are leaving High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) =>HS-0 =>LP-11 (LPM). This sequence and all three mode changes are illustrated below.

Figure 5-8: From High Speed Clock mode to LPM

Ultra Low Power Mode (LP-00: ULPM)

DSI-CLK+/- lanes can be driven to the Ultra Low power Mode (ULPM), when DSI-CLK lanes are entering LP-00 State. The entering way is from the Low Power Mode (LPM, LP-11 State) =>LP-10 =>LP-00 (ULPM). This sequence is illustrated below.

Figure 5-9: From LPM mode to ULPM

High Speed Clock Mode (HSCM)

DSI-CLK+/- lanes can be driven to the High Speed Clock Mode (HSCM), when DSI-CLK lanes are starting to work between HS-0 and HS-1 State. The entering way is from the Low Power Mode (LPM, LP-11 State) =>LP-01 =>LP-00 =>HS-0 =>HS-0/1 (HSCM). This sequence is illustrated below.

Figure 5-10: From LPM mode to HSCM

High Speed Clock Burst

The high speed clock (DSI-CLK+/-) is started before high speed data is sent via DSI-Dn+/- lanes. The high speed clock continues clocking after the high speed data sending has been stopped.

Figure 5-11: Switching the Clock Lane between HSCM and LPM

5.2.1.2 DSI-D0 Data Lane

DSI-D0+/- Data Lanes can be driven in different modes which are: Escape Mode, High-Speed Data Transmission and Bus Turnaround Request. The flow chart of the D0 data lanes is illustrated below.

Figure 5-12: DSI Data Lane D0 State Diagram

Description	Operation Code
High Speed Data Transmission Burst	LP11->LP01->LP00
Escape mode entry	LP11->LP10->LP00->LP01->LP00
Bus turn around	LP11->LP10->LP00->LP10->LP00
Exit Escape mode (Mark-1)	LP00->LP10->LP11

Table 5-4: Data Lane D0 Operation Modes

ESCAPE MODE

Data lanes (DSI-D0+/-) can be used in different Escape Modes when data lanes are in Low Power (LP) mode.

Figure 5-13: DSI Data Lane D0 general escape mode sequence

FL7703NI can support three different Escape Commands. The commands (EC) can be divided 2 different groups: Mode or Trigger. The HOST is informing to the driver IC that it is controlling data lanes (DSI-D0+/-) with the mode. Escape commands are defined as below table.

Escape Command	Command Type	Entry Command Pattern (First Bit→Last Bit Transmitted)
Low Power Data Transmission	Mode	1110 0001
Ultra-Low Power mode	Mode	0001 1110
Remote Application Reset	Trigger	0110 0010
Tearing Effect	Trigger	0101 1101
Acknowledge	Trigger	0010 0001

Table 5-5: Escape Mode Commands

Low-Power Data Transmission (LPDT)

The HOST can send data to the driver IC in Low-Power Data Transmission (LPDT) mode when data lanes are entering in Escape Mode and Low-Power Data Transmission (LPDT) command will be sent to this driver IC. The driver IC is also using the same sequence when it is sending data to the HOST. The Low Power Data Transmission (LPDT) is using a following sequence:

Figure 5-14: DSI Data Lane D0 LPDT sequence

Ultra Low Power State (ULPS)

The driver IC can enter this Ultra Low Power State to save power consumption when HOST send this ULPS command. Ultra Low Power State is using below sequence:

Figure 5-15: DSI Data Lane D0 ULPS sequence

Remote Application Reset (RAR)

The HOST can inform to the driver IC that it should be reset in Remote Application Reset (RAR) trigger when data lanes are entering in Escape Mode. The Remote Application Reset (RAR) is using a following sequence:

Figure 5-16: DSI Data Lane D0 RAR sequence

Tearing Effect (TEE)

The driver IC can inform to the HOST when a tearing effect event (New V-synch) has been happen on the driver IC by Tearing Effect (TEE). The Tearing Effect (TEE) is using a following sequence:

Figure 5-17: DSI Data Lane D0 TEE sequence

Acknowledge (ACK)

The driver IC can inform to the HOST when an error has not recognized on it by Acknowledge (ACK). The Acknowledge (ACK) is using a following sequence:

Figure 5-18: DSI Data Lane D0 ACK sequence

High Speed Data Transmission

The driver IC is entering High-Speed Data Transmission when Clock lanes DSI-CLK+/- have already been entered in the High-Speed Clock Mode by the HOST. Data lanes of the driver IC are entering (TSOT) in the High-Speed Data Transmission (HSDT) as below figure.

Figure 5-19: DSI Data Lane Entering High Speed Data Transmission

Leaving High Speed Data Transmission

The driver IC is leaving the High-Speed Data Transmission (TEOT of HSDT) when Clock lanes DSI-CLK+/- are in the High-Speed Clock Mode by the HOST and it is kept until data lanes are in LP-11 mode. Data lanes of the driver IC are leaving from the High-Speed Data Transmission (TEOT of HSDT) as follows

Figure 5-20: DSI Data Lane Leaving High Speed Data Transmission

Bus Turnaround (BTA)

The HOST or driver IC, which is controlling DSI-D0+/- Data Lanes, can start a bus turnaround procedure when it wants information from a receiver, which can be the HOST or driver IC. The HOST or driver IC is using the same sequence when this bus turnaround procedure is used. This sequence is described for reference purposes, when the HOST wants to do the bus turnaround procedure to the driver IC, as below.

Figure 5-21: DSI Bus Turn Around Procedure

5.2.2 DSI Packet Level Communication

The DSI protocol permits multiple packets which is useful for events such as peripheral initialization, where many registers may be loaded separate write commands at system startup. Below figure illustrates multiple HS Transmission packets.

LPS: Low power state
SOT: Start of Transmission
SP: Short Packet
LP: Long Packet
EOT: End of Transmission

Figure 5-22: DSI multiple HS transmission packets

The packet includes two types which are Long packet and short packet. The first byte of the packet, the Data Identifier (DI), includes information specifying the length of the packet. Command Mode systems send commands and an associated set of parameters, with the number of parameters depending on the command type.

5.2.2.1 General Packet Structure

Short packets

Specify the payload length using the Data Type field and are from two to nine bytes in length. Short packet is used for most Command Mode commands and associated parameters. Where short packets format include an 8-bit Data ID followed by zero to seven bytes and an 8-bit ECC. Below figure shows the structure of the Short packet.

SOT: Start of Transmission

DI(Data ID): 8-bit Contain Virtual Channel Identifier and Data Type.

Data 0 and Data 1: Packet Data (8+8bit)

ECC(Error Correction Code): The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header.

Figure 5-23: Structure of the short packet

Long packets

Specify the payload length using a two-byte Word Count field and then the payload maybe from 0 to 65,541 bytes in length. Long packets permit transmission of large blocks of pixel or other data. Below figure shows the structure of the Long packet. Long Packet Header composed of three elements: an 8-bit Data Identifier, a 16-bit Word Count, and 8-bit ECC. The Packet Footer has one element, a 16-bit checksum. Long packets can be from 6 to 65,541 bytes in length. Where $65,541 \text{ bytes} = (216-1) + 4 \text{ bytes PH} + 2 \text{ bytes PF}$

DI (Data ID): Contain Virtual Channel Identifier and Data Type.

WC (Word Count): 8+8 bits The receiver use WC to define packet end.

ECC (Error Correction Code): The Error Correction Code allows single-bit errors to be corrected and 2-bit errors to be detected in the Packet Header.

PF(Packet Footer): Mean 16-bit Checksum.

Figure 5-24: Structure of the long packet

According to packet form, basic elements include DI and ECC. Figure 4.44 the shows format of Data ID.

DI7	DI6	DI5	DI4	DI3	DI2	DI1	DI0
VC (Virtual Channel)		DT (Data Type)					

DI[7:6] → These two bits identify the data as directed to one of four virtual channels.

DI[5:0]: These six bits specify the Data Type, which specifies the size, format and, in some cases, the interpretation of the packet contents.

Figure 5-25: Format of data ID

Virtual Channel (VC)

Virtual Channel (VC) is a part of Data Identification (DI[7...6]) structure and it is used to address where a packet is wanted to send from the HOST. The FL7703NI supports Virtual Channel only when VC = 00.

Data Type (DT)

Data Type (DT) is a part of Data Identification (DI[5...0]) structure and it is used to define a type of the used data on a packet.

Data type, hex	Data type, binary	Description packet	Size
05h	00 0101	DCS Write, no parameters	Short
15h	01 0101	DCS Write, 1 parameter	Short
01h	00 0001	Sync Event, V Sync Start	Short
11h	01 0001	Sync Event, V Sync End	Short
21h	10 0001	Sync Event, H Sync Start	Short
31h	11 0001	Sync Event, H Sync End	Short
02h	00 0010	Color Mode (CM) Off Command	Short
12h	01 0010	Color Mode (CM) On Command	Short
22h	10 0010	Shut Down Peripheral Command	Short
32h	11 0010	Turn On Peripheral Command	Short
13h	01 0011	Generic Short Write, 1 parameter	Short
23h	10 0011	Generic Short Write, 2 parameter	Short
14h	01 0100	Generic Read, 1 parameter	Short
29h	10 1001	Generic Long Write	Long
06h	00 0110	DCS READ, no parameters	Short
37h	11 0111	Set Maximum Return Packet Size	Short
09h	00 1001	Null Packet, no data	Long
19h	01 1001	Blanking Packet, no data	Long
39h	11 1001	DCS Long Write/write_LUT Command Packet	Long
0Eh	00 1110	Packed Pixel Stream, 16-bit RGB, 5-6-5 Format	Long
1Eh	01 1110	Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
2Eh	10 1110	Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
3Eh	11 1110	Packed Pixel Stream, 24-bit RGB, 8-8-8 Format	Long
X0h and XFh, unspecified	xx 0000 xx 1111	DO NOT USE All unspecified codes are reserved	-

Table 5-6: Data Types from Host to the Driver IC

Data type, hex	Data type, binary	Description packet	Size
02h	00 0010	Acknowledge with Error Report	Short
21h	01 0001	Generic short READ Response, 1 byte returned	Short
22h	01 0010	Generic short READ Response, 2 byte returned	Short
1Ah	01 1010	Generic Read Long Response	Long
1Ch	01 1100	DCS Long READ Response	Long

Table 5-7: Data Types from the Driver IC to Host

Error Correction Code (ECC)

Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors on the Packet Header (PH).

Bits (P[7...0]) of the Error Correction Code (ECC) are defined, where the symbol '^' is presenting XOR function, as follows.

- P7 = 0
- P6 = 0
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23
- P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22
- P1 = D0^D1^D3^D4^D6^D8^D10^D12^D14^D17^D20^D21^D22^D23
- P0 = D0^D1^D2^D4^D5^D7^D10^D11^D13^D16^D20^D21^D22^D23

PACKET DATA (PD) ON THE LONG PACKET

Packet Data (PD) of the Long Packet is defined after Packet Header (PH) of the Long Packet. The number of the data bytes is defined on chapter "Word Count (WC) on the Long Packet".

PACKET FOOTER (PF) ON THE LONG PACKET

Packet Footer (PF) of the Long Packet is defined after the Packet Data (PD) of the Long Packet. The Packet Footer (PF) is a checksum value what is calculated from the Packet Data of the Long Packet. The checksum is using a 16-bit Cyclic Redundancy Check (CRC) value which is generated with a polynomial $X^{16}+X^{12}+X^5+X^0$.

5.2.2.2 Detail Format Description

Generic Write, 1 Parameter, Data Type = 01 0011 (13h)

Generic Write, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “00h”.

Generic Write, 2 Parameter, Data Type = 10 0011 (23h)

Generic Write, 2 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “parameter”.

Generic Long Write, Data Type = 10 1001 (29h)

Generic Long Write is always using a Long Packet from the HOST to the driver IC. The content can include Command (No Parameters) or Command with 1 or more parameters.

Generic Read, 1 Parameter, Data Type = 01 0100 (14h)

Generic Read, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The HOST has to define to the driver IC, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size”, which Data Type is 11 0111 and which is using Short Packet before the HOST can send “Generic Read, 1 Parameter” to the driver IC.

Display Command Set Write, No Parameter, Data Type = 00 0101 (05h)

Display Command Set (DCS) Write, No Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “00h”.

Display Command Set Write, 1 Parameter, Data Type = 01 0101 (15h)

Display Command Set (DCS) Write, 1 Parameter is always using a Short Packet from the HOST to the driver IC. The content of 2 payload bytes is “command” and “parameter”.

Display Command Set Long Write, Data Type = 11 1001 (39h)

Display Command Set (DCS) Long Write is always using a Long Packet from the HOST to the driver IC. The content can include Command (No Parameters) or Command with 1 or more parameters.

Display Command Set (DCS) Read, No Parameter, Data Type = 00 0110 (06h)

Display Command Set (DCS) Read, No Parameter is always using a Short Packet, from the HOST to the driver IC. The HOST has to define to the driver IC, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size”, which Data Type is 11 0111 and which is using Short Packet before the HOST can send “Display Command Set (DCS) Read, No Parameter” to the driver IC.

Null Packet, No Data , Data Type = 00 1001 (09h)

Null Packet, No Data is always using a Long Packet, what is defined on Data Type from the HOST to the driver IC. The purpose of this command is keeping data lanes in the high speed mode, if it is needed. The driver IC is ignored Packet Data what the HOST is sending.

Set Maximum Return Packet Size, Data Type = 11 0011 (37h)

Set Maximum Return Packet Size is always using a Long Packet, what is defined on Data Type from the HOST to the driver IC. The purpose of this command is specifies the maximum size of the payload in a Long packet transmitted from peripheral back to the host processor.

Sync Event (H Start, H End, V Start, V End), Data Type = XX 0001 (0xX1)

Sync Events are Short packets and, therefore, can time-accurately represent events like the start and end of sync pulses. As “start” and “end” are separate and distinct events, the length of sync pulses, as well as position relative to active pixel data, The Sync Events are defined as follows:

- Data Type = 00 0001 (01h) V Sync Start
- Data Type = 01 0001 (11h) V Sync End
- Data Type = 10 0001 (21h) H Sync Start
- Data Type = 11 0001 (31h) H Sync End

Color Mode On Command, and, Data Type = 01 0010 (12h)

Color Mode On is a Short packet command that switches a Video Mode driver IC to 8-colors mode for power saving.

Color Mode Off Command, Data Type = 00 0010 (02h)

Color Mode Off is a Short packet command that returns a Video Mode driver IC from 8-colors mode to normal display operation.

Shutdown Peripheral Command, Data Type = 10 0010 (22h)

Shutdown Peripheral command is a Short packet command that turns off the display in a Video Mode driver IC for power saving. Note the interface shall remain powered in order to receive the turn-on, or wake-up command.

Turn On Peripheral Command, Data Type = 11 0010 (32h)

Turn On Peripheral command is Short packet command that turns on the display in a Video Mode driver IC for normal display operation.

Blanking Packet (Long), Data Type = 01 1001 (19h)

A Blanking packet is used to convey blanking timing information in a Long packet. Normally, the packet represents a period between active scan lines of a Video Mode display, where traditional display timing is provided from the host processor to the driver IC.

Packed Pixel Stream, 16-bit Format, Long packet, Data Type = 00 1110 (0Eh)

Packed Pixel Stream 16-Bit Format is a Long packet used to transmit image data formatted as 16-bit pixels to a Video Mode driver IC. Pixel format is five bits red, six bits green, five bits blue, in that order. Note that the “Green” component is split across two bytes. Within a color component, the LSB is sent first, the MSB last.

Figure 5-26: 16-bit RGB Color Format, Long packet

Packed Pixel Stream, 18-bit Format, Long packet, Data type = 01 1110 (1Eh)

Packed Pixel Stream 18-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Pixel format is six bits red, six bits green, six bits blue, in that order.

Pixel Stream, 18-bit Format in Three Bytes, Long packet, Data Type = 101110 (2Eh)

Packed Pixel Stream 18-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored.

Packed Pixel Stream, 24-bit Format, Long packet, Data Type = 11 1110 (3Eh)

Packed Pixel Stream 24-Bit Format is a Long packet used to transmit image data formatted as 18-bit pixels to a Video Mode driver IC. Pixel format is eight bits red, eight bits green, eight bits blue, in that order.

Acknowledge with Error Report, Data Type = 00 0010(02h)

“Acknowledge with Error Report” is always using a Short Packet, from the driver IC to the HOST. The Packet Data can include bits, which are defining the current error, when a corresponding bit is set to ‘1’, as they are defined on the following table.

Bit	Description
0	SoT Error
1	SoT Sync Error
2	EoT Sync Error
3	Escape Mode Entry Command Error
4	Low-Power Transmit Sync Error
5	HS Receive Timeout Error
6	Reserved
7	Reserved
8	ECC Error, single-bit (detected and corrected)
9	ECC Error, multi-bit (detected, not corrected)
10	Checksum Error (long packet only)
11	DSI Data Type Not Recognized
12	DSI VC ID Invalid
13	Reserved
14	Reserved
15	Reserved

These errors of the previous packets can check “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands. The bit D0 of the “Read Display Signal Mode (0Eh)” command has been set to ‘1’ if a received packet includes an error.

The number of the packets, which are including an ECC or CRC error, are calculated on the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command.

DCS Read Long Response, Data Type = 01 1100(1Ch)

DCS Read Long Response is always using a Long Packet, from the driver IC to the Host. “DCS Read Long Response” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

DCS Read Short Response, 1 Byte Returned, Data Type = 10 0001(21h)

DCS Read Short Response, 1 Byte Returned is always using a Short Packet from the driver IC to the Host. “DCS Read Short Response, 1 Byte Returned” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

DCS Read Short Response, 2 Bytes Returned, Data Type = 10 0010(22h)

DCS Read Short Response, 2 Bytes Returned is always using a Short Packet from the driver IC to the Host. “DCS Read Short Response, 2 Bytes Returned” is used when the driver IC wants to response a DCS Read command, which the Host has sent to the driver IC.

Generic Read Long Response, Data Type = 01 1010(1Ah)

Generic Read Long Response is always using a Long Packet from the driver IC to the HOST. "Generic Read Long Response" is used when the driver IC wants to response a Generic Read command.

Generic Read Short Response, 1 Byte Returned, Data Type = 01 0001(11h)

Generic Read Short Response, 1 Byte Returned is always using a Short Packet from the driver IC to the HOST. "Generic Read Short Response, 1 Byte Returned" is used when the driver IC wants to response a Generic Read command, which the HOST has sent to the driver IC.

Generic Read Short Response, 2 Bytes Returned, Data Type = 01 0010(12h)

Generic Read Short Response, 2 Bytes Returned is always using a Short Packet from the driver IC to the HOST. "Generic Read Short Response, 2 Bytes Returned" is used when the driver IC wants to response a Generic Read command, which the HOST has sent to the driver IC.

5.3 Inversion

The FL7703NI can support the column, 1-dot, 1+2-dot, 2-dot, 3-dot, 4-dot and 8-dot inversion of liquid crystal. These inversions can provide a solution for improving display quality. In determining the inversion drive for the inversion cycle, check the quality of display on the liquid crystal panel.

The FL7703NI also can support the ZigZag inversion. Eight kinds of ZigZag inversion can be selected by software setting. These kinds are as below figure:

Figure 5-27: Source channels of ZigZag inversion mode

5.4 Gamma Function

The FL7703NI offers two kinds of Gamma adjustment ways to come to accord with LC characteristic, one kind is through Source Driver directly, another one is adjusted by the digital gamma correction. The adjustment of digital gamma is selected by internal register DGC_EN bit.

Figure 5-28: Gamma adjustments different of source driver with digital gamma correction

5.4.1 Gamma Characteristic Correction Function

The FL7703NI incorporates gamma adjustment function for the 16.7m-color display. Gamma adjustment operation is implemented by deciding the 17 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. These registers are available both for positive polarities and negative polarities.

The block consists of two gamma resistor streams one is for positive polarity and the other is for negative polarity, each one including 17 gamma reference voltages. VgP/N (0, 4, 8, 12, 28, 52, 76, 100, 131, 155, 179, 203, 227, 243, 247, 251, 255).

5.4.2 Gray Voltage Generator for Digital Gamma Correction

The FL7703NI digital gamma correction can reach the independent GAMMA curve of RGB. The FL7703NI utilizes DGC_LUT (Digital Gamma Correction Look Up Table) to change input data from 8-bit into 10-bit and sends 10-bit data to Dithering circuit, and then drive Source Driver via Dithering circuit. The following of the block diagram of the function.

Figure 5-29: Block diagram of digital gamma correction

There are 99 bytes DGC LUT to set R, G, B gamma independently. When DGC_EN=1, R, G, B gamma will mapping V0, V8, V16,, V240, V248, V255 voltage to the LUT register setting gray level voltage.

CDh	DGC_R								
Parameter	D7	D6	D5	D4	D3	D2	D1	D0	Default

5.5 Sleep Out - command and Self-diagnostic Functions of the display module

5.5.1 Register Loading Detection

Sleep Out-command (11h) is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (or similar device) to registers of the display controller is working properly. There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit, which is defined in command “Read Display Self-Diagnostic Result (0Fh)” (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (=increased by 1).

The flow chart for this internal function is following:

Figure 5-30: Sleep out flow chart—command and self-diagnostic functions

5.5.2 Functionality Detection

Sleep Out-command (11h) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function is comparing, if the display module still meets functionality requirements (e.g. booster voltage levels, timings, etc.). If functionality requirement is met, 1 bit will be inverted (=increased by 1), which is defined in command “Read Display Self- Diagnostic Result (0Fh)” (=RDDSDR) (The used bit of this command is D6). If functionality requirement is not the same, this bit (D6) is not inverted (=increased by 1). The flow chart for this internal function is shown as below.

Figure 5-31: Sleep out flow chart internal function detection

5.6 Power on/off Sequence

Power source IOVCC, VCI can be applied and powered down in any order. IOVCC, VCI can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, IOVCC, VCI must be powered down minimum 120msec after NRESET has been released.

During power off, if LCD is in the Sleep In mode, IOVCC, VCI can be powered down minimum 0msec after NRESET has been released.

NCS can be applied at any timing or can be permanently grounded. NRESET has priority over NCS.

Figure 5-32: The power supply ON/OFF setting for Display ON/OFF and Sleep In/out

5.6.1 Case 1: RESX line is held high or unstable by host at power on

If RESX line is held high or unstable by the host during power on, then a Hardware Reset must be applied after both VDD1, VDD2 and VDD3 have been applied- otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

Figure 5-33: Case 1: RESX line is held high or unstable by host at power on

5.6.2 Case 2: RESX line is held low by host at power on

If RESX line is held low (and stable) by the host during power on, then the RESX must be held low for minimum 10μsec after both VDD1, VDD2 and VDD3 have been applied.

Note: Unless otherwise specified timings herein show cross point at 50% of signal/power level

Figure 5-34: Case 2: RESX line is held low by host at power on

5.10 CABC

This driver IC provides a dynamic backlight control function as CABC (Content adaptive brightness control) to reduce the power consumption of the luminance source. There are two module architectures for CABC operation as below figure.

Figure 5-36: Two kinds of CABC Architecture

The driver IC will refer the gray scale content of display image to output a PWM waveform to LED driver for backlight brightness control. The PWM frequency can be adjusted by PWM_DIV parameters and the calculating equation as below:

$$F_{pwm_out} = \frac{36MHz / (2^{PWM_DIV[2:0]})}{(PWM_PERIOD[7:0] + 1) \times 255}$$

The figure in the following is the basic timing diagram which is applied FL7703NI to control LED driver.

Display Backlight Dimming Control

A dimming function is used when changing from brightness level to another. This dimming function curve is the same in increment and decrement directions. Dimming function can be enabled and disabled by software register. The basic idea is described below.

6.2.2 Software reset (01h)

01 H	SWRESET (Software Reset)																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	Write	0	0	0	0	0	0	0	1	01												
Parameter	NO PARAMETER																					
Description	When the Software Reset command is written, it causes a software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.) The display is blank immediately.																					
Restriction	It will be necessary to wait 5msec before sending new command following software reset. The display module loads all display suppliers' factory default values to the registers during this 5m sec. If SW Reset is applied during Sleep Out mode, it will be necessary to wait 120m sec before sending Sleep Out command. SW Reset command cannot be sent during Sleep Out sequence.																					
Register Availability	<table><tr><th>Status</th><th>Availability</th></tr><tr><td>Normal Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr><tr><td>Normal Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr><tr><td>Partial Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr><tr><td>Partial Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr><tr><td>Sleep In or Booster Off</td><td>Yes</td></tr></table>										Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In or Booster Off	Yes

6.2.10 Sleep In (10h)

10 H	SLPIN (Sleep In)																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	Write	0	0	0	1	0	0	0	0	10												
Parameter	No Parameter																					
Description	This command causes the LCD module to enter the minimum power consumption mode. In this mode the DC/DC converter is stopped, Internal display oscillator is stopped, and panel scanning is stopped. Sleep In Gate Output: STOP Source Output: 0V, Blanking display (over 1 frame display) * VCOM Output: 0V Internal Oscillator: STOP DC/DC Converter: OFF, 0V or VDD																					
Restriction	This command has no effect when module is already in sleep in mode. Sleep In Mode can only be exit by the Sleep Out Command (11H). It will be necessary to wait 15msec before sending next command; this is to allow time for the supply voltages and clock circuits to stabilize. It will be necessary to wait 120msec after sending Sleep Out command (when in Sleep In Mode) before Sleep In command can be sent.																					
Register Availability	<table><tr><th>Status</th><th>Availability</th></tr><tr><td>Normal Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr><tr><td>Normal Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr><tr><td>Partial Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr><tr><td>Partial Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr><tr><td>Sleep In or Booster Off</td><td>Yes</td></tr></table>										Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In or Booster Off	Yes

6.2.11 Sleep Out (11h)

11 H	SLPOUT (Sleep Out)																					
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	Write	0	0	0	1	0	0	0	1	11												
Parameter	No Parameter																					
Description	This command turns off sleep mode. In this mode the DC/DC converter is enabled, Internal display oscillator is started, and panel scanning is started. Blanking display (over 1frame display) * If DISPON 29H is set																					
Restriction	This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command, this is to allow time for the supply voltages and clock circuits to stabilize. The display module loads all display supplier's factory default values to the registers during this 15msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when the display module is already Sleep Out –mode. The display module is doing self-diagnostic functions during this 5msec. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.

6.2.45 Read DDB Start (A1h)

A1 H	RDDDBS (Read DDB Start)																							
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX														
Command	Read	1	0	1	0	0	0	0	1	A1														
1 st Parameter	Read	x	x	x	x	x	x	x	x	-														
2 nd Parameter		x	x	x	x	x	x	x	x															
3 Rd Parameter		x	x	x	x	x	x	x	x															
4 th parameter		x	x	x	x	x	x	x	x															
5 th parameter		1	1	1	1	1	1	1	1															
Description	This command returns the supplier identification and display module mode/revision information. Note: This information is not the same what “Read ID1 (DAh)”, “Read ID2 (DBh)” and “Read ID3 (DCh)” commands are returning. Note: Parameter 0xFF is an “Exit Code”, this means that there is no more data in the DDB block. This read sequence can be interrupted by any command and it can be continued by “Read DDB Continue (A8h)” command when the first parameter, what has been transferred, is the parameter, which has not been sent e.g. RDDDBS => 1st parameter has been sent => 2nd parameter has been sent=> interrupt => RDDDBC => 3rd parameter of the RDDDBS has been sent.

Description

- **XDK_ECP[1:0]**: Specify Pumping ratio of VSP / VSN with VCI.

XDK_ECP[1:0]	Ratio
0	X1.5
1	X2
2	X3
3	Setting Inhibited

- **PFM_DC_DIV[2:0]**: Specify PFM operation frequency FoscD.

PFM_DC_DIV[2:0]	FoscD
0	Fosc/1
1	Fosc/2
2	Fosc/3
3	Fosc/4
4	Fosc/5
5	Fosc/6
6	Fosc/7
7	Fosc/8

- **ECP_SYNC_EN**: Enable power IC pumping frequency synchronization.

- 1: Synchronize with external Hsync.
- 0: Synchronize with internal Hsync.

- **VGX_SYNC_EN**: Enable VGH/VGL pumping frequency synchronization.

- 1: Synchronize with external Hsync.
- 0: Synchronize with internal Hsync.

- **A_DC[1:0]**: Specify PFM operation half period.

A_DC[1:0]	Period
0	4/FoscD
1	6/FoscD
2	8/FoscD
3	12/FoscD

- **A_DTP[2:0]**: Specify PFM period of VSP.

- **A_DTN[2:0]**: Specify PFM period of VSN.

- **DTPS[2:0]**: Specify PFM period of VSP at soft start stage.

- **DTNS[2:0]**: Specify PFM period of VSN at soft start stage.

DTN[2:0] DTP[2:0] DTPS[2:0] DTNS[2:0]	Period
0	1/FoscD
1	2/FoscD
2	3/FoscD
3	4/FoscD
4	5/FoscD
5	6/FoscD
6	7/FoscD
7	8/FoscD

- **DCS[1:0]**: Specify PFM operation half period at soft start stage.

DCS[1:0]	Period
0	12/FoscD
1	24/FoscD
2	48/FoscD
3	60/FoscD

Description

This command is used to set MIPI related register.

• **VC_Main [1:0]:** Specify the virtual channel ID for multiple slave ID.

• **Lane [1:0]:** Specify the lane number selection.

Lane[1:0]	MIPI Lane
0	1 lane
1	2 lanes
2	3 lanes
3	4 lanes

• **DSI_LDO_SEL[2:0]:** Specify the MIPI LDO voltage selection.

DSI_LDO_SEL[2:0]	LDO voltage (V)	DSI_LDO_SEL[2:0]	LDO voltage (V)
0	1.4	4	1.7
1	1.45	5	1.8
2	1.5	6	1.9
3	1.6	7	2.0

• **RTERM[1:0]:** Specify the terminal resistance

RTERM [1:0]	Resistance (Ω)
0	110
1	100
2	90
3	80

• **IHSRX[3:0]:** Specify the MIPI Low High Speed driving ability .

IHSRX [3:0]	Driving Ability	IHSRX [3:0]	Driving Ability
0	X1	8	X9
1	X2	9	X10
2	X3	10	X11
3	X4	11	X12
4	X5	12	X13
5	X6	13	X14
6	X7	14	X15
7	X8	15	X16

• **Tx_clk[1:0]:** Specify TXCLK speed in DSI LP mode for transmission.

Tx_clk[1:0]	TXCLK
0	fDSICLK/4
1	fDSICLK/8
2	fDSICLK/16
3	fDSICLK/32

• **HFP_OSC[7:0]:** Specify the min. HFP number in DSI mode.

• **HBP_OSC[7:0]:** Specify the min. HBP number in DSI mode.

Parameter 3rd	R/W	ID3[7]	ID3[6]	ID3[5]	ID3[4]	ID3[3]	ID3[2]	ID3[1]	ID3[0]	1F
Parameter 4th	R	x	x	x	x	x	ID_TIME[2]	ID_TIME[1]	ID_TIME[0]	00
Description	This command is used for setting ID.									
	• ID1[7:0] / ID2[7:0] / ID3[7:0]: Set ID1 / ID2 / ID3 respectively - 04h / DAh / DBh / DEh change correspondingly									
	• ID_TIME[2:0]: Read ID OTP programming times.									
	ID_TIME[2:0]		OTP Programming times							
	0		NO OTPED							
	1		1							
	2		2							
	3		3							
4		4								

6.2.64 SETDDB (C4h)

C4 H	SETDDB									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	0	0	C4
Parameter 1st	R/W	DDB1[7]	DDB1[6]	DDB1[5]	DDB1[4]	DDB1[3]	DDB1[2]	DDB1[1]	DDB1[0]	00
Parameter 2nd	R/W	DDB2[7]	DDB2[6]	DDB2[5]	DDB2[4]	DDB2[3]	DDB2[2]	DDB2[1]	DDB2[0]	00
Parameter 3rd	R/W	DDB3[7]	DDB3[6]	DDB3[5]	DDB3[4]	DDB3[3]	DDB3[2]	DDB3[1]	DDB3[0]	00
Parameter 4th	R/W	DDB4[7]	DDB4[6]	DDB4[5]	DDB4[4]	DDB4[3]	DDB4[2]	DDB4[1]	DDB4[0]	00
Description	This command is used to set CMD DDB1~4 value. • DDB1[7:0] ~ DDB4[7:0]: Set DDB1 ~ DDB4.									

6.2.65 SETECO (C6h)

C6 H	SETECO									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	1	0	C6
Parameter 1st	R/W	ECO0[7]	ECO0[6]	ECO0[5]	ECO0[4]	ECO0[3]	ECO0[2]	ECO0[1]	ECO0[0]	01
Parameter 2nd	R/W	ECO1[7]	ECO1[6]	ECO1[5]	ECO1[4]	ECO1[3]	ECO1[2]	ECO1[1]	ECO1[0]	00
Parameter 3rd	R/W	ECO2[7]	ECO2[6]	ECO2[5]	ECO2[4]	ECO2[3]	ECO2[2]	ECO2[1]	ECO2[0]	CF
Parameter 4th	R/W	ECO3[7]	ECO3[6]	ECO3[5]	ECO3[4]	ECO3[3]	ECO3[2]	ECO3[1]	ECO3[0]	FF
Parameter 5th	R/W	ECO4[7]	ECO4[6]	ECO4[5]	ECO4[4]	ECO4[3]	ECO4[2]	ECO4[1]	ECO4[0]	00
Parameter 6th	R/W	ECO5[7]	ECO5[6]	ECO5[5]	ECO5[4]	ECO5[3]	ECO5[2]	ECO5[1]	ECO5[0]	FF
Description	This command is used to control ECO register.									

6.2.66 SETIO (C7h)

C7 H	SETIO									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	0	1	1	1	C7
Parameter 1st	R/W	PWM_O E	x	INVPWM	VOUT_O E	HOUT_O E				00
Parameter 2nd	R/W	x	V_DELA Y[2]	V_DELA Y[1]	V_DELA Y[0]	SMRPS_ IPHONE	H_DELA Y[2]	H_DELA Y[1]	H_DELA Y[0]	00

Description	This command is used to set I/O related register. • PWM_OE: PWM output CABC PWM signal. - 1: Enable CABC PWM signal. - 0: Disable CABC PWM signal. • INVPWM: Inverse polarity of CABC PWM signal. - 1: CABC PWM signal is inversed. - 0: Original CABC PWM signal. • VOUT_OE: VOUT pin output frame synchronization signal. • HOUT_OE: HOUT pin output horizontal synchronization signal. • V_DELAY[2:0]: Specify Vertical Sync. delay time. <table border="1" data-bbox="363 698 917 963"> <thead> <tr> <th>V_DELAY[2:0]</th><th>Delay time (ns)</th></tr> </thead> <tbody> <tr><td>0</td><td>0</td></tr> <tr><td>1</td><td>1666</td></tr> <tr><td>2</td><td>3332</td></tr> <tr><td>3</td><td>4998</td></tr> <tr><td>4</td><td>6664</td></tr> <tr><td>5</td><td>8330</td></tr> <tr><td>6</td><td>9996</td></tr> <tr><td>7</td><td>11662</td></tr> </tbody> </table> • H_DELAY[2:0]: Specify horizontal sync delay time. <table border="1" data-bbox="363 1030 917 1294"> <thead> <tr> <th>H_DELAY[2:0]</th><th>Delay time (ns)</th></tr> </thead> <tbody> <tr><td>0</td><td>0</td></tr> <tr><td>1</td><td>1666</td></tr> <tr><td>2</td><td>3332</td></tr> <tr><td>3</td><td>4998</td></tr> <tr><td>4</td><td>6664</td></tr> <tr><td>5</td><td>8330</td></tr> <tr><td>6</td><td>9996</td></tr> <tr><td>7</td><td>11662</td></tr> </tbody> </table>	V_DELAY[2:0]	Delay time (ns)	0	0	1	1666	2	3332	3	4998	4	6664	5	8330	6	9996	7	11662	H_DELAY[2:0]	Delay time (ns)	0	0	1	1666	2	3332	3	4998	4	6664	5	8330	6	9996	7	11662
V_DELAY[2:0]	Delay time (ns)																																				
0	0																																				
1	1666																																				
2	3332																																				
3	4998																																				
4	6664																																				
5	8330																																				
6	9996

6.2.67 SETCABC (C8h)

C8 H	SETCABC									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	0	0	1	0	0	0	C8
Parameter 1st	R/W	x	PWMDIV [2]	PWMDIV [1]	PWMDIV [0]	PWMDL Y_sel[2]	PWMDL Y_sel[1]	PWMDL Y_sel[0]	DBV_MS B_TYPE	10
Parameter 2nd	R/W	PWM_PE RIOD[7]	PWM_PE RIOD[6]	PWM_PE RIOD[5]	PWM_PE RIOD[4]	PWM_PE RIOD[3]	PWM_PE RIOD[2]	PWM_PE RIOD[1]	PWM_PE RIOD[0]	40
Description	This command is used to set CABC related register.									
	• PWMDIV[2:0]: CABC PWM Frequency Fpwm control.									
	PWMDIV[2:0]		PWM Fpwm							
	0		Fosc/1							
	1		Fosc/2							
	2		Fosc/4							
	3		Fosc/8							
	4		Fosc/16							
	• PWMPERIOD[7:0]: CABC PWM output frequency control.									
	PWMPERIOD[7:0]		PWM frequency							
	0		Fpwm/1							
	1		Fpwm/1							
	2		Fpwm/2							
	:		:							
	3F		Fpwm/127							

6.2.68 SETCLOCK (CBh)

CB H	SETCLOCK																																													
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX																																				
Command	W	1	1	0	0	1	0	1	1	CB																																				
Parameter 1st	R/W	OSC_DIV2	FORCE_ULP[2]	FORCE_ULP[1]	FORCE_ULP[0]	x	FRADJ[2]	FRADJ[1]	FRADJ[0]	03																																				
Description	This command is used to set OSC related register.																																													
	• OSC_DIV2: Halve PWM Frequency - 1: Halve PWM Frequency - 0: Not Halve PWM Frequency																																													
	• FORCE_ULP: Enter ULP Mode - 5: Enter ULP Mode - Leave ULP Mode by HWRESET only																																													
	• FRADJ[2:0]: Adjust internal oscillator frequency (Fosc).																																													
	<table><thead><tr><th colspan="3">FRADJ</th><th>Internal oscillator frequency</th></tr></thead><tbody><tr><td>0</td><td>0</td><td>0</td><td>20.2M</td></tr><tr><td>0</td><td>0</td><td>1</td><td>24.2M</td></tr><tr><td>0</td><td>1</td><td>0</td><td>30.1M</td></tr><tr><td>0</td><td>1</td><td>1</td><td>36.9M</td></tr><tr><td>1</td><td>0</td><td>0</td><td>41.1M</td></tr><tr><td>1</td><td>0</td><td>1</td><td>49.1M</td></tr><tr><td>1</td><td>1</td><td>0</td><td>20.2M</td></tr><tr><td>1</td><td>1</td><td>1</td><td>20.2M</td></tr></tbody></table>										FRADJ			Internal oscillator frequency	0	0	0	20.2M	0	0	1	24.2M	0	1	0	30.1M	0	1	1	36.9M	1	0	0	41.1M	1	0	1	49.1M	1	1	0	20.2M	1	1	1	20.2M

Description

This command is used to set EQ related register.

• FL7703NI do source EQ starting from HSYNC.

- **PNOEQ[7:0]**: Specify the temporal spacing between HSYNC and PEQGND.
- **NNOEQ[7:0]**: Specify the temporal spacing between HSYNC and NEQGND.
- **PEQGND[7:0]**: Specify the source EQ GND period when Source up to positive voltage.
- **NEQGND[7:0]**: Specify the source EQ GND period when Source down to negative voltage.
- **PEQVCI[7:0]**: Specify the source EQ VCI period when Source up to positive voltage.
- **NEQVCI[7:0]**: Specify the source EQ VCI period when Source down to negative voltage.
- **PEQVCI1[7:0]**: Specify the temporal period of PEQVCI1.
- **NEQVCI1[7:0]**: Specify the temporal period of NEQVCI1.

Description

PNOEQ[7:0] NNOEQ[7:0] PEQGND[7:0] NEQGND[7:0] PEQVCI[7:0] NEQVCI[7:0] PEQVCI1[7:0] NEQVCI1[7:0]	EQ Period
0	0*4/Fosc
1	0*4/Fosc
2	2*4/Fosc
3	3*4/Fosc
:	:
FD	253*4/Fosc
FE	254*4/Fosc
FF	255*4/Fosc

- **ESD_DET_DATA_WHITE:** Select white or black pattern to protect GOA glass.
- **ESD_WHITE_EN:** Enable ESD detection function to protect GOA glass.
 - At Sleep-Out State, IC automatically displaying white or black pattern when MIPI-DSI is interrupted or not sent.
- **SLPIN_OPTION**
 - 0: Need VSYNC (additional frame) after Sleep-In command to display sleep-in blanking frame then into Sleep-In State.
 - 1: No Need VSYNC (additional frame) after Sleep-In command to display sleep-in blanking frame then into Sleep-In State.
- **VEDIO_NO_CHECK_EN:** Enable video function detection.
 - 0: Enable vedio function detection.
 - 1: Disable vedio function detection, continually displaying white or black pattern after sleep-out blanking frame without detecting if MIPI video comes or not
- **ESD_WHITE_GND_EN:** Enable ESD white pattern scanning voltage pull ground.
 "0", Disable scanning voltage pull ground.
 "1", Enable scanning voltage pull ground.
- **ESD_DET_TIME_SEL[1:0]:** ESD detection function period.

ESD_TIME_SEL[1:0]	Period
0	1 frames
1	2 frames
2	4 frames
3	8 frames

Parameter 63rd	R/W	COFF2[9]	COFF[8]	CON2[9]	CON2[8]	PANEL_SEL_INI[3]	PANEL_SEL_INI[2]	PANEL_SEL_INI[1]	PANEL_SEL_INI[0]	00

This command is to set forward GIP timing.

• **REF_EN:**

- 0: SHR0, SHR1, CHR, CHR2 refer to Internal VSYNC
- 1: SHR0, SHR1, CHR, CHR2 refer to Internal DE
- ◎ REF_EN=1: SHR0, SHR1, CHR, CHR2 = MSB Sign Bit.

• **PANEL_SEL[3:0]:** Specify GIP signal at abnormal power off state.

Panel_sel[3:0]	GIP signal State
1	GND
2	VGH2 (VSP)
4	VGL
8	VGH

• **PANEL_SEL_INI[3:0]:** Specify GIP signal at initial state.

PANEL_SEL_INI	GIP signal State
1	VGH2
2	VGH
4	VGL
8	GND

Description

Description

- **SHR0[12:0]**: Specify the starting position of GIP STV group 0 (STV0_0).
- **SHR1[12:0]**: Specify the starting position of GIP STV group 1 (STV1_0).

SHR0[12:0] SHR1[12:0] (Hex)	Starting Position
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
FFF	4095 HSYNC

- **SPON[9:0]**: Specify the distance of STV rising edge and HYSNC.
- **SPOFF[9:0]**: Specify the distance of STV falling edge and HYSNC.

SPON[9:0] SPOFF[9:0] (Hex)	Distance
0	$0 \times (2/F_{osc})$
1	$1 \times (2/F_{osc})$
2	$2 \times (2/F_{osc})$
:	:
3FF	$1023 \times (2/F_{osc})$

- **SHR0_1[3:0] / SHR0_2[3:0] / SHR0_3[3:0]**: Specify the STV0_x distance with STV0_0.
- **SHR1_1[3:0] / SHR1_2[3:0] / SHR1_3[3:0]**: Specify the STV1_x distance with STV1_0.
(X=1~3)

- **SHP[3:0]**: Specify the STV signal high pulse width.

SHP[3:0] (Hex)	Width
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
F	16 HSYNC

- **SCP[3:0]**: Specify the total number of STV signal.

SCP[3:0] (Hex)	STV NO.
0	1
1	2
2	3
:	:
F	16

Description

CHR0[7:0]=0

- **CHR[7:0]:** Specify the starting position of GIP CKV group 0 (CKV0_0).
- **CHR2[7:0]:** Specify the starting position of GIP CKV group 1 (CKV1_0).

CHR[7:0] CHR2[7:0] (Hex)	Starting Position
0	0 HSYNC
1	1 HSYNC
2	2 HSYNC
:	:
FF	255 HSYNC

- **CHP[3:0]:** Specify the CKV signal high pulse width.
- **CHP2[3:0]:** Specify the CKV1 signal high pulse width

CHP[3:0] CHP2[3:0] (Hex)	Width
0	1 HSYNC
1	2 HSYNC
2	3 HSYNC
:	:
F	16 HSYNC

- **CCP[3:0]:** Specify the total period cycle of CKV signal.
- **CCP2[3:0]:** Specify the total period cycle of CKV1 signal.

CCP[3:0] CCP2[3:0] (Hex)	CKV Period.
0	1 HSYNC
1	2 HSYNC
2	3 HSYNC
:	:
F	16 HSYNC

- **CON[9:0]**: Specify the distance of CKV rising edge and HYSNC.
- **COFF[9:0]**: Specify the distance of CKV falling edge and HYSNC.
- **CON2[9:0]**: Specify the distance of CKV1 rising edge and HYSNC.
- **COFF2[9:0]**: Specify the distance of CKV1 falling edge and HYSNC.

CON[9:0] COFF[9:0] CON2[9:0] COFF2[9:0] (Hex)	Distance
0	$0 \times (2/F_{osc})$
1	$1 \times (2/F_{osc})$
2	$2 \times (2/F_{osc})$
:	:
FF	$255 \times (2/F_{osc})$

Description

- **CGTS_L[21:0]**: Select Left side GIP output pad signal.
 - 1: Output pad assign as STV.
 - 0: Output pad assign as CKV.
- **CGTS_R[21:0]**: Select Right side GIP output pad signal.
 - 1: Output pad assign as STV.
 - 0: Output pad assign as CKV.
- **CGTS_INV_L[21:0]**: Reverse the polarity of Left side GIP output pad signal.
 - 1: Reverse the polarity.
 - 0: Normal polarity.
- **CGTS_INV_R[21:0]**: Reverse the polarity of Right side GIP output pad signal.
 - 1: Reverse the polarity.
 - 0: Normal polarity.

Description

- **USER_GIP_GATE[7:0]**: Specify the extra gate counter at blanking area.

USER_GIP_GATE[7:0] (Hex)	Gate number
0	0
1	1
2	2
:	:
FF	255

- **COSx_L[3:0]**: Specify Left side GIP output pad signal.
- **COSx_R[3:0]**: Specify Right side GIP output pad signal.
(x=1~22)

COS (Hex)	GIP OUTPUT		
	CGTS="1"	CGTS="0"	
		CKS="0"	CKS="1"
0	STV0_0	CKV0_0	CKV1_0
1	STV0_1	CKV0_1	CKV1_1
2	STV0_2	CKV0_2	CKV1_2
3	STV0_3	CKV0_3	CKV1_3
4	STV1_0	CKV0_4	CKV1_4
5	STV1_1	CKV0_5	CKV1_5
6	STV1_2	CKV0_6	CKV1_6
7	STV1_3	CKV0_7	CKV1_7
8	Always Low	Always Low	
9	STV2_0	CKV All On	
A	STV2_1	YS1_Signal	
B	STV2_2	YS2_Signal	
C	STV2_3	CKV All On_2	
D	SMD_RST	YS1_Signal_2	
E	Display Area Line Ext	YS2_Signal_2	
F	Always High	Always High	

- **GIP_OPT[22:0]**: Specify GIP optional setting for GIP signal.

Parameter 39th	R/W	HSYNC_TO_CL1_CNT10[7]	HSYNC_TO_CL1_CNT10[6]	HSYNC_TO_CL1_CNT10[5]	HSYNC_TO_CL1_CNT10[4]	HSYNC_TO_CL1_CNT10[3]	HSYNC_TO_CL1_CNT10[2]	HSYNC_TO_CL1_CNT10[1]	HSYNC_TO_CL1_CNT10[0]	02

This command is to set backward GIP timing.

- **YS1_SEL[1:0]**: Specify YS1 Signal Mode.
- **YS2_SEL[1:0]**: Specify YS2 Signal Mode.

YS1[1:0] YS2[1:0] (Hex)	YS1/YS2 Signal Mode
0	INYS1/INYS2
1	INYS1 or INVS2
2	INYS1 and INYS2

- **YS_FLAG_EN**: Enable YS signal function.
- **YS1_XOR**: Reverse YS1 signal.
- **YS2_XOR**: Reverse YS2 signal.
- **ALL_ON_EN**: Enable ALL ON function.
- **CK_ALL_ON_EN**: Enable CKV ALL ON function.
- **STV_ALL_ON_EN**: Enable STV ALL ON function.
- **USER_GIP_GATE[7:0]**: Specify the distance of GIP ALL On rising edge and DE.
- **CK_ALL_ON_WIDTH1[5:0] / CK_ALL_ON_WIDTH2[5:0] / CK_ALL_ON_WIDTH3[5:0]**: Specify the timing of YS1 and YS2 signal.

Description

- **EQOPT[1:0]:** Specify GIP output EQ signal.

EQOTP (Hex)	P_EQ	N_EQ
0	Yes	Yes
1	No	Yes
2	Yes	No
3	No	No

- **EQ_SEL[1:0]:** Specify GIP output EQ signal level.

EQ_SEL (Hex)	P_EQ	N_EQ
0	-	-
1	VSP	VSP
2	VSP	VSP
3	VSP	VSP

- **EQ_DELAY[7:0]:** Specify the distance of EQ rising edge and HYSNC @ EQ_SEL=0.

EQ_DEALY (Hex)	Distance
0	$0 \times (2/F_{osc})$
1	$1 \times (2/F_{osc})$
2	$2 \times (2/F_{osc})$
:	:
FF	$255 \times (2/F_{osc})$

- **EQ_DELAY_HSYNC[3:0]:** Specify the distance of EQ rising edge and HYSNC.

EQ_DEALY_HS (Hex)	Distance
0	0 Hsync
1	1 Hsync
2	2 Hsync
:	:
16	16 Hsync

- **HSYNC_TO_CL1_CNT10[9:0]:** Specify the GIP reference HSYNC between external HSYNC

HSYNC_TO_CL1_CNT10[9:0] (Hex)	Distance
0	$0/F_{osc}$
1	$1/F_{osc}$
2	$2/F_{osc}$
:	:
1FF	$511/F_{osc}$

6.2.79 SETCOLOR (EBh)

EB H	SETCOLOR									
	R/W	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	W	1	1	1	0	1	0	1	1	EB

7.2.2 DSI DC Characteristics

LP Mode

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
Logic high level input voltage	V_{IHLPCD}	LP-CD	450	-	1350	mV
Logic low level input voltage	V_{ILLPCD}	LP-CD	0	-	200	mV
Logic high level input voltage	V_{IHLPRX}	LP-RX(CLK, D0)	880	-	1350	mV
Logic low level input voltage	V_{ILLPRX}	LP-RX(CLK, D0)	0	-	550	mV
Logic low level input voltage	$V_{ILLPRXULP}$	LP-RX(CLK ULP mode)	0	-	300	mV
Logic high level output voltage	V_{OHLPTX}	LP-TX(D0)	1.1	-	1.3	V
Logic low level output voltage	V_{OLLPTX}	LP-TX(D0)	-50	-	50	mV
Logic high level input current	V_{IH}	LP-CD, LP-RX	-	-	10	uA
Logic low level input current	V_{IL}	LP-CD, LP-RX	-10	-	-	uA
Input pulse rejection	SGD	DSI-CLK+/-, DSI-D0+/1	-	-	300	Vps

Figure 7-1: Input glitch rejections of low-power receivers

High Speed Mode

Parameter	Symbol	Conditions	Spec.			Unit
			Min.	Typ.	Max.	
Input common mode	V_{CMCLK} V_{CMDATA}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	70	-	330	mV
Input common mode variation <450 MHz	$V_{CMRCLKL}$ $V_{CMRDATAL}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-50	-	50	mV
Input common mode variation >450 MHz	$V_{CMRCLKM}$ $V_{CMRDATAM}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	100	mV
Low-level differential Input threshold	V_{THLCLK} $V_{THLDATA}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-70	-	-	mV
High-level differential Input threshold	V_{THHCLK} $V_{THHDATA}$	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	70	mV
Single ended input low voltage	V_{ILHS}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-40	-	-	mV
Single ended input high voltage	V_{IHHS}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	460	mV
Differential input termination resistor	R_{TERM}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	80	100	125	Ω
Single-ended threshold voltage for termination enable	V_{TERMEN}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	450	mV
Termination capacitor	C_{TERM}	DSI_CP/DSI_CN DSI_D0P/DSI_D0P	-	-	-	pF

Figure 7-2: Differential voltage range and Command mode voltage

7.3 AC characteristics

7.3.1 Serial Interface Characteristics

Figure 7-3: Serial Interface Characteristics

(VSSA=0V, IOVCC=1.8V, VCI=2.8V, $T_A = 25^\circ\text{C}$)

Signal	Symbol	Parameter	Min.	Max.	Unit	Description
CSX	t_{CSS}	Chip select setup time (Write)	15	-	ns	-
	t_{CSS}	Chip select setup time (Read)	60	-		
	t_{CSH}	Chip select hold time (Write)	15	-		
	t_{CSH}	Chip select hold time (Read)	65	-		
DCX	t_{AST}	Address setup time	0	-	ns	-
	t_{AHT}	Address hold time (Write/Read)	10	-		
SCL (Write)	t_{WC}	Write cycle	66	-	ns	-
	t_{WRH}	Control pulse "H" duration	15	-		
	t_{WRL}	Control pulse "L" duration	15	-		
SCL (Read)	t_{RC}	Read cycle	150	-	ns	-
	t_{RDH}	Control pulse "H" duration	60	-		
	t_{RDL}	Control pulse "L" duration	60	-		
SDA (Input)	t_{DS}	Data setup time	10	-	ns	For maximum $C_L=30\text{pF}$
	t_{DH}	Data hold time	10	-		
SDA (Output)	t_{ACC}	Read access time	-	100	ns	For minimum $C_L=8\text{pF}$
	t_{OH}	Output disable time	10	-		

Note: The input signal rise time and fall time (t_r , t_f) is specified at 15 ns or less.

Logic high and low levels are specified as 30% and 70% of IOVCC for Input signals.

Table 7-2: Serial Interface Characteristics

7.3.2 DSI Interface Timing Characteristics

High Speed Mode

Figure 7-4: DSI clock timing Characteristics

Figure 7-5: Rising and falling time on clock and data channel

(VSSA=0V, IOVCC=1.65V to 3.3V, VCI=2.5V to 3.3V, TA = -30 to 70°C)

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_CP/ DSI_CN	Double UI instantaneous	2xUIINST	4LANE: 3.30 3LANE: 2.85 @ VDDD=1.8V	-	25	ns
	UI instantaneous	UIINSTA UIINSTB	4LANE: 1.67 3LANE: 1.43 @ VDDD=1.8V	-	12.5	ns

	Data to clock hold time	T _{DH}	0.15xUI	-	-	ps
DSI_CP/ DSI_CN	Differential rise time for clock	T _{DRTCLK}	150	-	0.3UI	ps
	Differential fall time for clock	T _{DFTCLK}	150	-	0.3UI	ps
DP/DN	Differential rise time for data	T _{DRTDATA}	150	-	0.3UI	ps
	Differential fall time for data	T _{DFTDATA}	150	-	0.3UI	ps

Table 7-3: DSI High Speed Mode Characteristics

Low Power Mode

Figure 7-6: BTA from HOST to Display Module Timing

Figure 7-7: BTA from Display Module Timing to HOST

(VSSA=0V, IOVCC=1.65V to 3.3V, VCI=2.3V to 3.3V, T_A = -30 to 70°C)

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Length of LP-00/LP01/LP10/LP11 Host → Display module	T _{LPXM}	50	-	-	ns
	Length of LP-00/LP01/LP10/LP11 Display module → Host	T _{LPXD}	50	-	-	ns
	Time-out before the MPU start driver	T _{TA-SURE}	T _{LPXD}	-	2xT _{LPXD}	ns
	Time to drive LP-00 by display module	T _{TA-GET}	5xT _{LPXD}	-	-	ns
	Time to drive LP-00 after turnaround request Host	T _{TAGO}	4xT _{LPXD}	-	-	ns

Table 7-4: DSI Low Power Mode Characteristics

DSI BURSTS

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Length of LP-00/LP01/LP10/LP11	T _{LPX}	50	-	-	ns
	Time to Driver LP-00 to prepare for HS transmission	T _{HS-PREPARE}	40+4UI	-	85+6UI	ns
	Time to enable data receiver line termination	T _{HS-TERM-EN}	-	-	35+4xUI	ns
	Time to drive LP-00 by display module	T _{TA-GET}	5xT _{LPXD}	-	-	ns
	Time to drive LP-00 after turnaround request Host	T _{TAGO}	4xT _{LPXD}	-	-	ns

Table 7-5: DSI Low Power Mode to High Speed Mode Timing

NOTE:
If the last bit is HS-0, the transmitter changes from HS-0 to HS-1
If the last bit is HS-0, the transmitter changes from HS-1 to HS-0

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_D0P/ DSI_D0P	Time-Out at Display Module to Ignore Transition Period of EoT	T _{HS-SKIP}	40	-	55+4xUI	ns
	Time to Driver LP-11 after HS Burst	T _{HS-EXIT}	100	-	-	ns

Table 7-6: DSI Low Power Mode to High Speed Mode Timing

Signal	Item	Symbol	Spec.			Unit
			Min.	Typ.	Max.	
DSI_CP/ DSI_CN	Time that the MCU shall continue sending HS clock after the last associated Data Lane has transitioned to LP mode	T _{CLK-POST}	60+52xUI	-	-	ns
	Time to drive HS differential state after last payload clock bit of a HS transmission burst	T _{CLK-TRAIL}	60	-	-	ns
	Time to drive LP-11 after HS burst	T _{HS-EXIT}	100	-	-	ns
	Time to drive LP-00 to prepare for HS transmission	T _{CLK-PREPARE}	38	-	95	ns
	Time-out at Clock Lane Display Module to enable HS Termination	T _{CLK-TERM-EN}	-	-	38	ns
	Minimum lead HS-0 drive period before starting Clock	T _{CLK-PREPARE} + T _{CLK-ZERO}	300	-	-	ns
	Time that the HS clock shall be driven prior to any associated data Lane beginning the transition from LP to HS mode	T _{CLK-PRE}	8xUI			

Table 7-7: Clock Lanes High Speed Mode to/from Low Power Mode Timing

7.3.3 Reset input timing

Figure 7-8: Reset input timing

Symbol	Parameter	Related Pins	Spec.			Note	Unit
			Min.	Typ.	Max.		
tRESW	Reset low pulse width ⁽¹⁾	NRESET	10	-	-	-	μs
tREST	Reset complete time ⁽²⁾	-	15	-	-	When reset applied during SLPIN mode	ms
		-	120	-	-	When reset applied during SLPOUT mode	ms

Table 7-8: Reset Input Timing

Note: (1) Spike due to an electrostatic discharge on NRESET line does not cause irregular system reset according to the following table.

NRESET Pulse	Action
Shorter than 5 μs	Reset Rejected
Longer than 10 μs	Reset
Between 5 μs and 10 μs	Reset Start

- (2) During the resetting period, the display will be blanked (The display is entering blanking sequence, which Maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for H/W reset.
- (3) During Reset Complete Time, ID and VCOM value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 15ms after a rising edge of NRESET.
- (4) Spike Rejection also applies during a valid reset pulse as shown as below:

- (5) It is necessary to wait 15msec after releasing NRESET before sending commands. Also Sleep Out command cannot be sent for 120msec.

7.3.4 Timings for DSI video mode- Vertical timings

Figure 7.9: Vertical timings for DSI

Resolution= 720x1280(1OVCC=1.8V, VCI=2.8V)

Parameter	Spec.			Unit
	Min.	Type.	Max.	
VSA	2	-	Note	Line
VFP	2	-	Note	Line
VBP	2	-	Note	Line
VACTIVE	-	1280	-	Line
Frame Rate	-	60	-	Hz

Table 7.9: Vertical timings for DSI

Note : VSA、VBP、VFP are related to E9h. Please refer to the GIP Timing for VSA、VBP、VFP setting

7.3.5 Timings for DSI video mode- Horizontal timings

Figure 7.10: Horizontal timings for DSI

Parameter	Spec.			Unit
	Min.	Type.	Max.	
HSA	6	-	-	DCK
HBP	34	-	-	DCK
HFP	40	-	-	DCK
HACTIVE	-	720	-	DCK

Table 7.10: Horizontal timings for DSI

Note :

1. HS > 0.1us (6-DCK @ 342.8Mbps /4-lane, Frame rate 60Hz, min DSI CLK rate)
2. HBP > 0.6us (34-DCK @ 342.8Mbps /4-lane, Frame rate 60Hz, min DSI CLK rate)
3. HFP > 0.7us (40-DCK @ 342.8Mbps /4-lane, Frame rate 60Hz, min DSI CLK rate)

8. Reference Application

8.1 Interface

The display, which is using DSI interface, is connected to the MPU as it is illustrated below.

Figure 8-1: Interfacing for MIPI by Setting Lane [1:0]='11'

Notes:

1. When TE is not in use, please let it open.
2. When PWM is not in use, please let it open.
3. Connect DSI_D3_P/N to DSI_VSS in 3 data lanes application (LANE[1:0]='10').
4. Connect DSI_D3P/N and DSI_D2P/N to DSI_VSS in 2 data lanes application (LANE[1:0]='01').

8.2 Connections with Panel

Figure 8-2: Source Pin Connection for Panel

The relationship between Sn output sequence and SS PANEL / BGR PANEL.

8.5 Maximum Layout Resistance

Name	Type	Maximum layout resistance	Unit
IOVCC	Power supply	10	Ω
VCI	Power supply	10	Ω
VSSD	Power supply	10	Ω
VSSA	Power supply	10	Ω
DSI_VSS	Power supply	10	Ω
IM0,IM1,LANSEL	Input	100	Ω
VCSW1, VCSW2	Output	30	Ω
DCX,SCL,CSX,RESX	Input	100	Ω
SDA	Input/Output	100	Ω
SDO	Output	100	Ω
VOUT,HOUT	Output	100	Ω
PWM	Output	100	Ω
VCOM	Output	10	Ω
DSI_D0P	Input/Output	8	Ω
DSI_D0N	Input/Output	8	Ω
DSI_CP	Input	8	Ω
DSI_CN	Input	8	Ω
DSI_D1P	Input	8	Ω
DSI_D1N	Input	8	Ω
DSI_D2P	Input	8	Ω
DSI_D2N	Input	8	Ω
DSI_D3P	Input	8	Ω
DSI_D3N	Input	8	Ω
VDDD	Output	10	Ω
VSP,VSN	Input/Output	10	Ω
VSPROUT, VSNROUT	Output	10	Ω
VTRIMOUT	Output	10	Ω
VGL	Output	10	Ω
VGH	Output	10	Ω
DSI_LDO	Output	10	Ω
OSC	Input	100	Ω
VTESTOUTP, VTESTOUTN	Output	100	Ω
CGOUTL_1~22	Output	30	Ω
CGOUTR_1~22	Output	30	Ω
