STVD STVU	I/O	These two pins are the device start pulse input or output pin. The function of these two pins depends on the status of U_D pin. <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th></th> <th>STVD</th> <th>STVU</th> </tr> </thead> <tbody> <tr> <td>U_D = H</td> <td>input</td> <td>output</td> </tr> <tr> <td>U_D = L</td> <td>output</td> <td>input</td> </tr> </tbody> </table>		STVD	STVU	U_D = H	input	output	U_D = L	output	input

## 6. FUNCTION DESCRIPTION

### 6.1. Device operation

In the condition of U\_D=H, the STVD start pulse input is sensed at the rising edge of CKV and stored in the first stage of shift register, which causes the first scan signal is output from the OUT[1] output pin. While stored data is transferred to the next stage shift register at the rising edge of next CKV, new data of STVD is sensed and stored simultaneously.

The output pin (OUT[1] to OUT[960]) supplies VGH voltage or VGL voltage to the LCD panel depending on the data stored in the shift register. For normal operation, a VGH voltage is output one by one from OUT[1] to OUT[960] in sync with CKV pulse.

After 960 CKV rising edge are past, the STVU goes up to high level at the 960<sup>th</sup> falling edge of CKV and goes down to low level at the 961<sup>th</sup> falling edge of CKV. This STVU output signal becomes the STVD start pulse input of next cascaded gate driver device.

During any "H" state of OE, the corresponding output channels are forced to VGL level regardless of CKV. The channel output returns to normal status as soon as OE go back to "L".

### 6.2. Relationship among U\_D, and STV1/STV2

U_D	Start pulse		Data transfer direction
	Input	Output	
H	STVD	STVU	OUT[1]→OUT[2]→OUT[3]→...→OUT[960]
L	STVU	STVD	OUT[960]→OUT[959]→OUT[958]→...→OUT[1]

### 6.3. Device power supply

The EK73202ABLT must be used by the following conditions.

\* VGH - VGL = 40V (max.)

\* VGH - GND = 7 ~ 35V

Example:

Figure 3. Device power supply

The input signal level of CKV, U\_D, OE, STVD, STVU, MODE0, MODE1, SEL,XON have to swing between VCC and VGND. The signal output level of start pulse (STVU or STVD) to the next stage cascaded device is VCC for "H" and GND for "L".

## 6.4. Power ON/OFF sequence

To prevent the device from damage due to latch up, the power ON/OFF sequence shown below must be followed.

When power on: VCC→VGL→VGH

When power off: VGH→VGL→VCC

**Figure 4.** Power ON/OFF sequence

6.5. Start Pulse Input Limitation

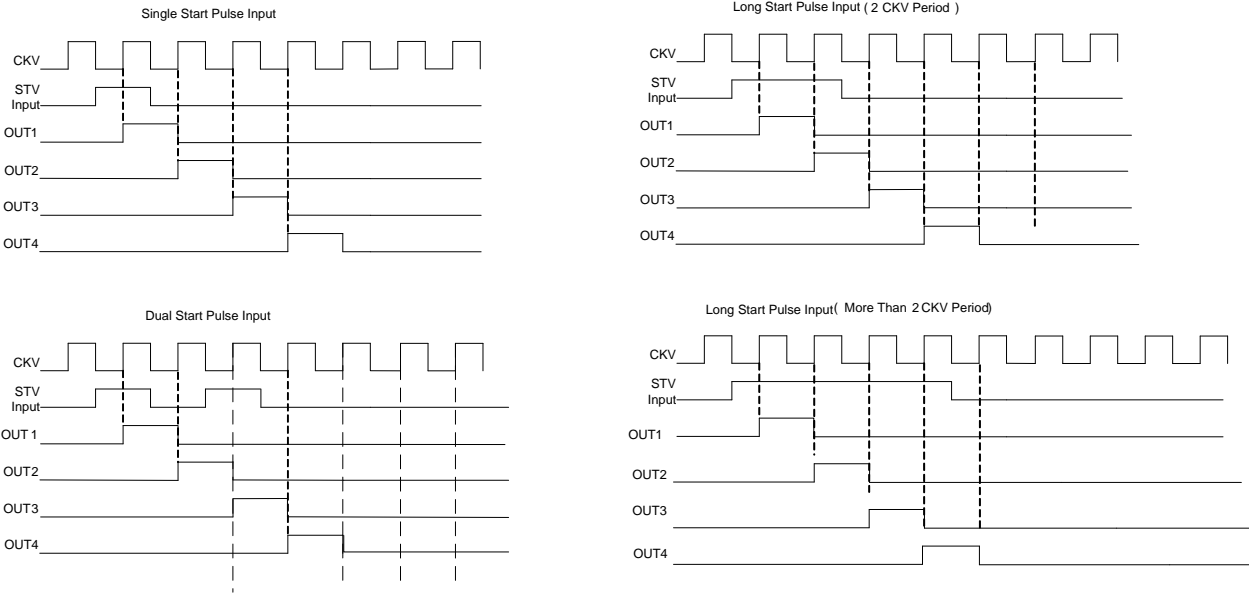

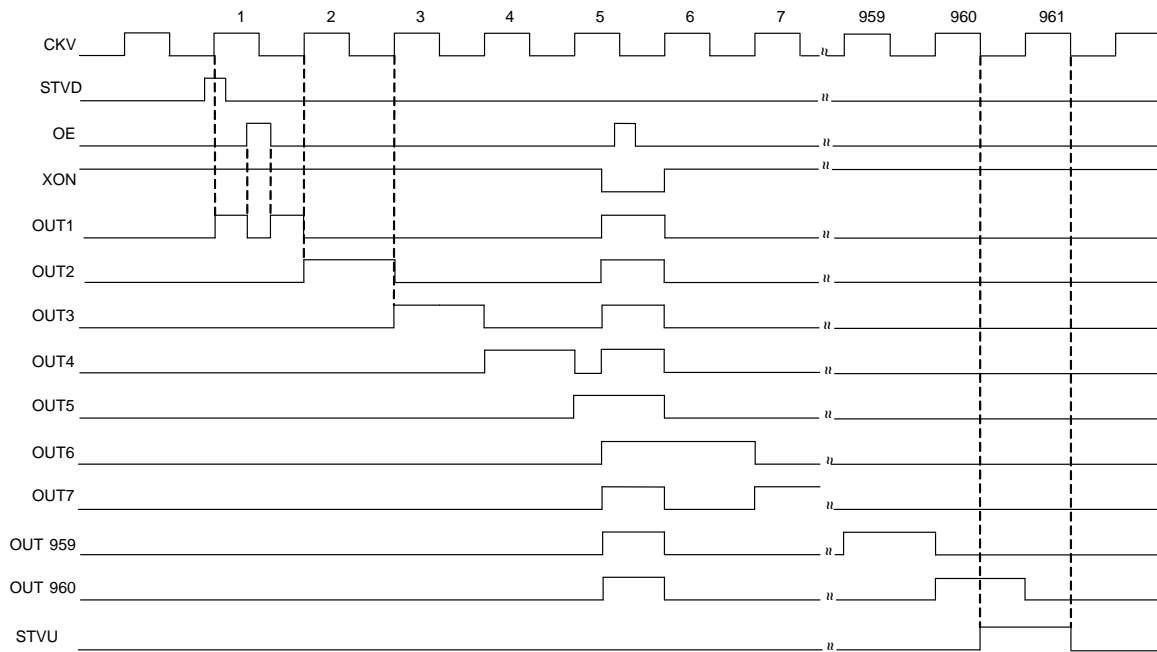

Figure 5. Start pulse Input limitation

Note1: The Output Turn-On Timing will change following by Start pulse waveform  
Note2: For Dual Start Pulse Input, the space of STV between two pulse must be 1 CKV period  
Note3: For Long Start Pulse Input (more than 2 CKV Period), the Length of Start Pulse must be less than the Length of 6 CKV Period.
